Access Control

Proximity Readers | Intercoms | Keypads | Biometric Authentication | Detection Loops

Features & Benefits

- We work with carefully selected manufacturers to bring you the latest technology in access control.
- Entry level budget through to high security sensitive sites, our tailored solutions are customised to your specific application.
- Products that are intuitive and easy to use, ranging from standalone access control, through to advanced PC based solutions that can be interfaced with existing building infrastructure and security systems.
- Scalable, we have systems that can control sites from 1 door to 1000's of doors, with up to 50,000 users.
- Available with data storage and event reporting.
- Fully trained & accredited engineers.
- Full technical support and countrywide service team available 365 days per year, 24/7.
- 5 year guarantee on all products. **T&C's apply*

Applications

- Small/medium premises
- Large corporate sites
- Multiple-site premises
- Government buildings
- Schools / Universities
- Leisure facilities
- Car parks

PRODUCTS	
Proximity Readers, Cards & Key Fobs	A proximity card or prox card is a “contactless” smart card which can be read without inserting it into a reader device. Also available as convenient, pocket sized tokens or key fobs.
Keypads	Keypads are weather & vandal proof, access is gained by using a numeric code. We also have a range that are a combination of keypad and proximity readers all in one. Available in 2 sizes in a choice of colours with backlit keypads and 1 to 60 sec door open time.
Intercoms	Depending on your budget and application we have a variety of professional and hardwearing intercom systems. Varying from basic telephone and audio door entry systems, to easy-to-use IP networked, touch panel entry systems that interface with an app on your mobile device.
Biometric Authentication	This security process relies on the unique biological characteristics of an individual to verify that they are who they say they are, and can be used as a form of identification for access control. There are variety of options available such as: face recognition, fingerprint identification, hand geometry, retina or iris scans, signature or voice analysis.
Vehicle Detection Loops	Vehicle detection loops, also called inductive-loop traffic detectors, are used to detect and track vehicles passing or arriving at a certain point, for instance approaching traffic barriers, automatic gates or traffic lights. The loops automatically trigger the gates or barriers to open, or the traffic lights to change.
Radio Transmitters	In some access control applications radio frequency remote controls are desirable, for example securing domestic gate systems, which can be activated from a vehicle up to 100m away. Some authorised users may be unable to access conventional switches and may prefer the convenience of a hand-held fob (or transmitter).

ACCESSORIES	
Consumables <i>Additional or replacement</i>	Cards / Fobs / Tokens Supply Kits Ribbon Kits
Printers	Complete solution for designing and printing ID cards on site. Superb edge-to-edge imaging. Produces vivid and vibrant full colour photos, graphics and text across the entire card surface, enhanced bar code printing and sharp reproduction of edges and fine text.
